

Machine Learning Exercise Sheet 12

Dimensionality Reduction & Clustering

Homework

Matrix Factorization

Problem 1: Download the notebook `exercise_12_matrix_factorization.ipynb` and `exercise_12_matrix_factorization_ratings.npy` from Piazza. Fill in the missing code and run the notebook. Convert the evaluated notebook to PDF and append it to your other solutions before uploading.

Autoencoders

Problem 2: We train a linear autoencoder on D -dimensional data. The autoencoder has a single K -dimensional hidden layer, there are no biases, and all activation functions are identity ($\sigma(x) = x$).

- Why is it usually impossible to get zero reconstruction error in this setting if $K < D$?
- Under which conditions is this possible?

Gaussian Mixture Model

Problem 3: Consider a mixture of K Gaussians

$$p(\mathbf{x}) = \sum_k \pi_k \mathcal{N}(\mathbf{x} \mid \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k).$$

Derive the expected value $\mathbb{E}[\mathbf{x}]$ and the covariance $\text{Cov}[\mathbf{x}]$.

Hint: it is helpful to remember the identity $\text{Cov}[\mathbf{x}] = \mathbb{E}[\mathbf{x}\mathbf{x}^T] - \mathbb{E}[\mathbf{x}]\mathbb{E}[\mathbf{x}]^T$.

Problem 4: Consider two random variables $\mathbf{x} \in \mathbb{R}^D$ and $\mathbf{y} \in \mathbb{R}^D$ distributed according to two different Gaussian mixture models with $\boldsymbol{\theta}^x = \{\pi^x, \boldsymbol{\mu}^x, \boldsymbol{\Sigma}^x\}$ and $\boldsymbol{\theta}^y = \{\pi^y, \boldsymbol{\mu}^y, \boldsymbol{\Sigma}^y\}$, i.e.

$$p(\mathbf{x} \mid \boldsymbol{\theta}^x) = \sum_{k=1}^{K_x} \pi_k^x \mathcal{N}(\mathbf{x} \mid \boldsymbol{\mu}_k^x, \boldsymbol{\Sigma}_k^x),$$

$$p(\mathbf{y} \mid \boldsymbol{\theta}^y) = \sum_{l=1}^{K_y} \pi_l^y \mathcal{N}(\mathbf{y} \mid \boldsymbol{\mu}_l^y, \boldsymbol{\Sigma}_l^y),$$

and the random variable $\mathbf{z} = \mathbf{x} + \mathbf{y}$.

- a) Describe a generative process (process of drawing samples) for \mathbf{z} .

Upload a single PDF file with your homework solution to Moodle by 02.02.2020, 11:59pm CET. We recommend to typeset your solution (using L^AT_EX or Word), but handwritten solutions are also accepted. If your handwritten solution is illegible, it won't be graded and you waive your right to dispute that.

- b) Explain in a few sentences why $p(\mathbf{z} \mid \boldsymbol{\theta}^x, \boldsymbol{\theta}^y)$ is again a mixture of Gaussians.
- c) State the probability density function $p(\mathbf{z} \mid \boldsymbol{\theta}^x, \boldsymbol{\theta}^y)$ of \mathbf{z} .

Problem 5: Download the notebook `exercise_12_clustering.ipynb` from Piazza. Fill in the missing code and run the notebook. Convert the evaluated notebook to PDF and append it to your other solutions before uploading.

In-class Exercises

K-Medians

Problem 6: Consider a modified version of the K -means objective, where we use L_1 distance instead.

$$\mathcal{J}(\mathbf{X}, \mathbf{Z}, \boldsymbol{\mu}) = \sum_{i=1}^N \sum_{k=1}^K z_{ik} \|\mathbf{x}_i - \boldsymbol{\mu}_k\|_1$$

This variation of the algorithm is called K -medians. Derive the Lloyd's algorithm for this model.

Gaussian Mixture Model

Problem 7: Derive the E step update for Gaussian mixture model.

Problem 8: Derive the M step update for Gaussian mixture model.

Expectation Maximization Algorithm

Problem 9: Consider a mixture model where the components are given by independent Bernoulli variables. This is useful when modelling, e.g., binary images, where each of the D dimensions of the image \mathbf{x} corresponds to a different pixel that is either black or white. More formally, we have

$$p(\mathbf{x} \mid \mathbf{z} = k) = \prod_{d=1}^D \theta_{kd}^{x_d} (1 - \theta_{kd})^{1-x_d}.$$

That is, for a given mixture index $\mathbf{z} = k$, we have a product of independent Bernoullis, where θ_{kd} denotes the Bernoulli parameter for component k at pixel d .

Derive the EM algorithm for the parameters $\boldsymbol{\theta} = \{\theta_{kd} \mid k = 1, \dots, K, d = 1, \dots, D\}$ of a mixture of Bernoullis.

Assume here for simplicity, that the distribution of components $p(\mathbf{z})$ is uniform: $p(\mathbf{z}) = \prod_{k=1}^K \pi_k^{z_k} = \prod_{k=1}^K \left(\frac{1}{K}\right)^{z_k}$.
